Making the building envelope airtight

- Buildings must be constructed to be permanently airtight.
- Leaking areas in the building shell cause high energy loss, unpleasant draughts and can result in massive damage to the building due to mould.

- To create the airtight building shell, vapour control layers are applied to the inside of the building and sealed airtight. All overlaps, joints and penetrations must be carefully sealed airtight.

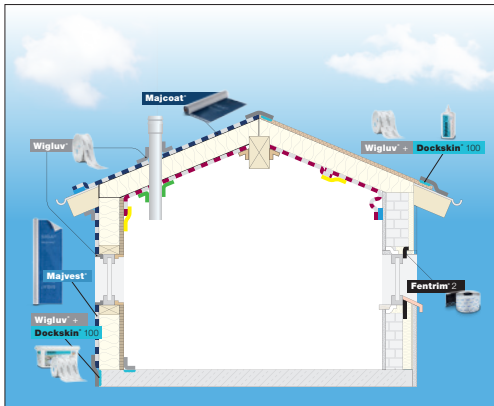

- Use the following high-performance SIGA products for the reliable sealing of your airtight building shell:
- They are extremely strong, free from residential toxins, environmentally friendly and secure a permanently airtight building shell.

- Proof of airtightness is provided with the Blower-Door-Test.

Making the building envelope wind and rainproof

- The wind-tight building shell is created by the permanently sealed roof underlay membrane and facade membrane.
- When the envelope is not wind-tight, cold outside air can easily cool down the insulation. Snow, rain, insects and wood pests can enter the construction unhindered and damage it.
- All overlaps, joints and penetrations must be carefully sealed windtight.

- The diffusion resistance value of the roof underlay membranes and facade membranes is lower than that for vapour control layers so that the moisture does not collect underneath the membrane.
- High thermal demands and the multitude of surfaces require high-quality products which bond securely and durably.
- SIGA offers a comprehensive system of products perfectly tailored to your requirements.
- So you can easily avoid damage to your building!

Airtight joining of window

Functional level ① inside the room: airtightness

- Each window joining inside the room must be airtight.

The airtight building level

- Prevents uncontrolled thermal loss
- Stops the penetration of humid indoor air in to the functional level ② (heat insulation)
- Prevents condensates and mould
- Prevents drafts

Functional level ② centre: heat insulation

- Transfers the load of the window
- Ensures heat and sound insulation
- Must always remain dry, is protected by the functional level ① and ③.

- Use the high-performance SIGA products Fentrim IS 20 and Fentrim 20 for the reliable airtight joining of your windows.
- Fentrim is quick and easy to apply, has an extremely strong adhesion and is immediately 100% tight.

Wind-tight and rainproof joining of window

Functional level ③ outside: driving rain and windtightness

- Outside joints of windows and doors must be windtight and impermeable to driving rain.

- Stops the penetration of driving rain in to the functional level ② (heat insulation)
- Prevents condensates and mould
- Prevents ingress of wind and thus draughts

Diffusion gradient:

With regard to water vapour diffusion, the principle “10 x less permeable on the inside than on the outside” applies.

- $sd = 20 \text{ m}$ for inside application
- $sd = 2 \text{ m}$ for outside application

- Use the high-performance SIGA products Fentrim IS 2 and Fentrim 2 for the reliable windtight joining of your windows.
- Fentrim is quick and easy to apply, has an extremely strong adhesion and is immediately 100% tight.

SIGA-house-tight

SIGA benefits

- ✓ **innovative**
every year the SIGA-research team applies for numerous patents

- ✓ **in partnership**
SIGA annually trains
 - 2,500 building and construction professionals at the SIGA Academy in Switzerland
 - 30,000 craftsmen and architects on site at the customers' premises

- ✓ **professional**
SIGA production processes guarantee best quality

Factory at Schachen

Factory at Ruswil

- ✓ **international**
SIGA produces at 2 locations in Switzerland and employs 525 employees in over 27 countries

Product benefits

- ✓ **strong adhesiveness in cold and heat**
construction professionals save time and achieve maximum safety

- ✓ **resistant to ageing**
construction professionals prevent future structural damage to buildings - protecting their clients' and their own best interests

- ✓ **no residential toxins**
no pollutants in the ambient air

- ✓ **SIGA In an open system**
In addition, free choice of commercially available vapour control layers and roof underlay membranes in combination with SIGA high-performance adhesives

Wall: Solid construction *Airtight on the inside*

Mounting vapour control layer at internal insulation

- Use double-sided adhesive Twinet 20 when mounting vapour control layers on metal or timber substructures
- Avoids leaky stapling points

- Apply vapour control layer with the writing facing you

- Overlap the vapour control layer by approx. 10 cm

- Seal overlap with Sicrall avoiding tension and wrinkles

Wall: Solid construction *Airtight on the inside*

How it should look:

- Vapour control layer mounted on substructure and bonded to be permanently airtight

Majrex® 200

P. 115

Sicrall® 60

P. 118

Twinet® 20

P. 126

Wall: Solid construction *Airtight on the inside*

Joining vapour control layer to solid wall construction - plastered masonry

- 1** Apply bead before mounting the vapour control layer

or

- 2** Apply bead after mounting the vapour control layer

- Clean the substrate
- Apply Primur, align and press it down
- Cut with a knife and press on

3

- Remove backing strip

4

- Make a stress-relief loop in the vapour control layer

Wall: Solid construction
Airtight on the inside

- Press vapour control layer firmly onto Primur bead free from creases and tension

For overlaps:

- Apply a short bead of Primur (about 10 cm) to vapour control layer at the overlap

- Mount second membrane, press it on

How it should look:

- Vapour control layer is airtightly sealed against plastered masonry with Primur roll

Wall: Solid construction *Airtight on the inside*

Tips and tricks

For unevenness

- Make a loop in the bead ① and fill unevenness airtightly ②

- Apply Primur roll
- Then fill the unevenness airtightly using the Primur tubular bag

Primur® roll

P. 123

Majrex® 200

P. 115

Majpell® 5

P. 116

Wall: Solid construction *Airtight on the inside*

Joining vapour control layer to solid wall construction - plastered masonry

or

Apply Primur compound using the SIGA tubular bag applicator gun

- Twin-spiked nozzle opens Primur bag
- Transparent tube shows fill level

Apply Primur compound using the SIGA cartridge applicator gun

- Sturdy applicator gun with long-lasting professional quality
- With drip stop – hands and gun remain clean

A

Wet method

- Apply an 8 mm Primur bead
- Release secured vapour control layer immediately

- Make a stress-relief loop in the vapour control layer
- Gently press vapour control layer onto Primur bead – **do not press flat!**
- Primur bead must remain at least 4 mm thick

Wall: Solid construction

Airtight on the inside

B Dry method

- Apply an 8mm Primur bead and **allow it to dry** for 1 to 3 days

- Make a stress-relief loop in the vapour control layer
- Press vapour control layer **firmly** onto the Primur bead without tension or wrinkles

Primur® cartridge

P. 122

Primur® tubular bag

P. 122

Wall: Solid construction *Airtight on the inside*

Joining vapour control layer to solid wall construction – non-plastered masonry or concrete

- Affix 50 mm side to vapour control layer
- Affix perforated 85 mm side to solid wall construction
- Apply free from stress and tension
- Press on firmly

Note:

- If Fentrim 20 50/85 is mounted on **non-plastered** masonry it must be plastered over to form the airtight layer
- The width of the substrate to be plastered covered by Fentrim must not exceed 60 mm without counting the Fentrim perforated zone.

Fentrim® 20 50/85

P. 140

Wall: Solid construction *Airtight on the inside*

Joining timber to solid wall construction – non-plastered masonry or concrete

- Joining timber wall construction to **non-plastered** masonry or concrete

- Affix 50 mm side to wood-based panel

- Unfold Fentrim 20 50/85
- Press on firmly

- Remove backing strip
- Fixing
- Apply free from stress and tension
- Press on firmly

Wall: Solid construction
Airtight on the inside

How it should look:

- Timber wall construction joined to non-plastered masonry or concrete

Note:

- If Fentrim 20 50/85 is mounted on **non-plastered** masonry it must be plastered over to form the airtight layer
- The width of the substrate to be plastered covered by Fentrim must not exceed 60 mm without counting the Fentrim perforated zone.

Fentrim® 20 50/85

P. 140

Wall: Solid construction *Airtight on the inside*

Joining window to solid wall construction - Tips and tricks

- Clean all substrates to ensure high adhesive strength

- Fold the front end of the protruding backing strip back so that it is ready at hand and can be easily removed later
- Install the window

- Apply free from stress and tension

- Press the tape on firmly with a roller to ensure even more protection

Wall: Solid construction
Airtight on the inside

- Fill joint seam with insulation material without cavities

- Overlap the tape at the joints by approx. 5 cm

If Fentrim is plastered:

- Don't seal more than 50 % of the soffit or reveal depth and max. 60 mm without counting the Fentrim perforated zone.

Leakages, cracks, penetrations:

- Seal using the reliable high-performance sealant Meltell

Wall: Solid construction *Airtight on the inside*

Preparing the skirt – without windowsill joint profile

Initial situation:

- Frame provided

- **Bond laterally** to frame at the bottom starting in the centre
- Press on firmly

Corners:

- Form a loop: 1.5 x joint width
- Bond or press together firmly

- Repeat on all sides
- Press on firmly

Wall: Solid construction *Airtight on the inside*

5

Overlaps:

- Apply with about 5 cm overlap
- Cut off

6

Overlaps:

- Apply with about 5 cm overlap

7

- Fold back protruding backing strip
- Align and fix free from tension

8

After skirt preparation for the inside with Fentrim 20:

- Turn frame
- Prepare the skirt for the outside with Fentrim 2 or Fentrim IS 2

Wall: Solid construction *Airtight on the inside*

Preparing the skirt – without windowsill joint profile

Initial situation:

- Frame provided

- Bond to the windowsill joint profile at the **bottom**
- Projecting by joint width + approx. 6 cm on both sides
- Press on firmly

- Bond laterally to the frame
- Projecting by about the joint width at the bottom
- Press on firmly

Wall: Solid construction *Airtight on the inside*

Top corners:

- Form a loop: 1.5 x joint width
- Bond or press together firmly
- Repeat on the other side

- Bond to all sides of the frame
- Press on firmly
- Projecting by the joint width at the bottom
- Cut off

Bottom corners:

- Make a rectangular cut up to the folded edge
- Fold over
- Press on firmly
- Repeat on the other side

After skirt preparation for the inside with Fentrim 20:

- Turn frame
- Prepare the skirt for the outside with Fentrim 2 or Fentrim IS 2

Wall: Solid construction *Airtight on the inside*

Join skirt to masonry

Initial situation:

- Window installed with prefabricated skirt

- Remove protruding backing strip step by step
- Align and fix free from tension
- Remove second backing strip
- Press on firmly

Bottom corners:

- Bond laterally to the reveal
- Form trough
- Repeat on the other side

- Align and fix free from tension
- Bond to bottom of trough
- Press on firmly

Wall: Solid construction *Airtight on the inside*

5

6

Top corners:

- Bond loop into corner free from tension
- Press on firmly
- Repeat on the other side

How it should look:

- Prefabricated skirt attached to masonry

Joint plastered:

Joint covered:

Fentrim®20

P. 142

Fentrim®IS 20

P. 144

Wall: Solid construction *Airtight on the inside*

Connection for windows, protruding inside

Initial situation:

- Window installed with prefabricated skirt

- Bond with the narrow side to the edge at the frame bottom
- Projecting about 10 cm on both sides
- Press on firmly

Corners:

- Cut narrow side up to the folded edge at an angle of 45°

- Fold over
- Press on firmly
- Repeat on all sides

Wall: Solid construction *Airtight on the inside*

- Remove protruding backing strip
- Align and fix free from tension
- Remove second backing strip
- Press on firmly
- Repeat on all sides

How it should look:

- Window connection inside

Joint plastered:

Joint covered:

Fentrim®20

P. 142

Fentrim®IS 20

P. 144

Wall: Solid construction *Airtight on the inside*

Joining window to base plate

Initial situation:

- Floor-deep window / façade element installed

- Clean the substrates to be bonded
- Apply Dockskin 200
- Use a roller to apply thinly and over the entire surface of the concrete floor
- Wait until Dockskin 200 is completely dry

- Roll out Fentrim to required length
- Add approx. 15–20 cm on both sides (to form sides of trough)
- Cut Fentrim to required length

- Remove about 10 cm of 1st backing strip and stick to window / façade element using a small area of adhesion
- Extend approx. 15–20 cm on left and right

Wall: Solid construction *Airtight on the inside*

- Remove 1st backing strip little by little
- Align and fix tension-free
- Press on firmly

- Remove more backing strip little by little
- Bend without introducing tension
- Press on firmly

How it should look:

- Floor-deep window / façade element connected to concrete floor

Docks skin® 200

P. 138

Fentrim® 330 grey

P. 139

Wall: Solid construction *Airtight on the inside*

Connection joints for windows, doors and facades, leaks and penetrations

- Airtight connection joint seals

- Penetrations e.g. bolts, screws, brackets

C Rule of thumb		
	Width [mm]	Depth [mm]
	6	6
	8	8
	10	10
	15	8
	20	10
	25	12
	30	15
	35	18

- Joint width < 10 mm Width:Depth = 1 : 1
- Joint width > 10 mm Width:Depth = 2 : 1

- (a) Sealant
(b) Backfill material e.g. PE round cord

Meltell®

P. 146

Wall: Solid construction

Windtight and rainproof on the outside

- Wind-tight and rainproof sealing of connection joints

- Penetrations e.g. cable penetrations

- Cracks, leaks, breaks imperfections

Meltell®

P. 146

Wall: Solid construction

Windtight and rainproof on the outside

Joining window to solid wall construction

- Window installed on the outside surface

- Suggestion: Mount a wedge for better water discharge $\geq 5^\circ$. Observe the manufacturer's specification

- Bond the narrow side to the edge at the frame bottom
- Projecting on both sides
- Remove backing strip and press on firmly
- Cut into the excess, bisecting the angle, and press on

- Bond the narrow side to the lateral edge of the frame
- Projecting on both sides
- Remove backing strip and press on firmly

Wall: Solid construction

Windtight and rainproof on the outside

- Bond the narrow side to the top edge of the frame
- Projecting on both sides
- Remove backing strip and press on firmly
- Cut into the excess, bisecting the angle, and press on

How it should look:

- Window installed on the outside surface joined

Window installed on the outside surface sealed airtight with Fentrim IS 2

Fentrim® IS 2

P. 145

Wall: Solid construction

Windtight and rainproof on the outside

Joining window to solid wall construction

- Window installed flush with the outside surface

- Bond with the small side to the frame flush with the frame bottom edge
- Projecting about 10 cm on both sides
- Press on firmly

- Remove protruding backing strip step by step
- Align and fix free from tension

- Repeat on all sides

Wall: Solid construction *Windtight and rainproof on the outside*

5

6

How it should look:

- Window joined outside

Thereafter:

- Cover connection with insulation

Joint plastered:

Joint covered:

P. 115

Majpell® 5

P. 116

Twinet® 20

P. 126

Wall: Timber construction *Airtight on the inside*

Vapour control layer overlaps

- Release the Sicral backing strip
- Position Sicral in the centre of the overlap and secure it in place
- Remove backing strip
- Apply Sicral free of tension and creases and press it down vigorously by hand

How it should look:

- The overlap is sealed with Sicral 60 and permanently airtight

Butt-joint

- Apply Sicral along the centre of the joint
- Press it on with a hard rubber roller
- Improves the immediate adhesion

Sicral® 60

P. 118

Injection hole

- Pull out Sicrall 170
- Measure to the required length
- Tear over the blade

- Sicrall is easy to tear-off at perforation

- Press it on with a hard rubber roller
- Improves instant adhesion and is easy to use

Sicrall® 170

P. 119

Wall: Timber construction

Airtight on the inside

Timber connection at internal & external corners

- Unfold a short piece of Corvum
- **Make a cut in** centre of side without backing strip
- Fold over at a 90° angle
- Bond together

- Prefold to fit tightly into corner
- Fold back backing strip

- Stick down Corvum corner and press on well
- Repeat first in every inside corner

- Then connect the inside corners:
- Position Corvum accurately in corner and bond side without backing strip first, pressing on firmly
- Remove backing strip and press on

Tips and tricks

Using the backing strip for simple and quick application:

- First fold back the front end of the backing strip, this way, the backing strip is ready at hand and can be quickly removed later
- Then apply Corvum to fit

Corvum® 30/30

P. 124

Wall: Timber construction *Airtight on the inside*

Wall joint - timber construction outside corner

- Affix Corvum to wall with folded edge flush against outside edge
- Add about 3 cm at each end and cut off

- Remove backing strip
- Unfold

- Cut into the corner from the inside out, approximately bisecting the angle
- **Start cut just short of corner!**

- Fold around outside corner
- Press on

Wall: Timber construction *Airtight on the inside*

- Repeat on each side

- Fit a short piece of Corvum into corner
- Remove the backing strip
- Press on
- Repeat on each side

How it should look:

- Outside corner is permanently airtightly sealed with Corvum 30/30

Corvum® 30/30

P. 124

Wall: Timber construction

Airtight on the inside

Joining window to timber wall construction

- Cut off a short piece, unfold
- Make a 12 mm cut in the centre of one side

- Fold over at a 90° angle
- Bond together
- Make a corner crease

- Remove backing strip

- Press into inside corner
- Affix 12 mm side of Corvum to window frame
- Repeat in each inside corner

Wall: Timber construction

Airtight on the inside

- Then connect the inside corners:
- Affix 12 mm side of Corvum to window frame
- Measure and cut to the correct length

- Remove backing strip
- Unfold
- Press on
- Repeat on each side

How it should look:

- Recessed window frame airtightly bonded with Corvum 12/48
- Corvum is invisible behind cladding

Corvum® 12/48

P. 125

Wall: Timber construction

Airtight on the inside

Joining window to timber wall construction alternative:

- Bond to windowsill joint profile **at the bottom**
- Projecting by joint width plus approx. 6 cm on both sides
- Press on firmly

- Bond laterally to the frame
- Press on firmly

Top corners:

- Form a loop: 1.5 x joint width
- Bond or press together firmly
- Repeat on the other side

- Install the window

- Form trough

Wall: Timber construction

Airtight on the inside

- Cut into the corners
- Remove backing strip and press on firmly

- Repeat on each side

How it should look:

- Window frame joined airtight to timber wall construction

Fentrim® IS 20

P. 144

Wall: Timber construction ***Airtight on the inside***

Base joint inside

Initial situation:

- Wooden wall installed

- Clean the substrates to be bonded
- Apply Dockskin 200
- Use a roller to apply thinly and over the entire surface of the concrete floor
- Wait until Dockskin 200 is completely dry

- Roll out Fentrim to required length
- Add approx. 15–20 cm extra on both sides
- Cut Fentrim to required length

- Remove about 10 cm of 1st backing strip and stick to wooden wall
- Allow approx. 15–20 cm to extend to left and right

Wall: Timber construction *Airtight on the inside*

- Remove 1st backing strip little by little
- Align and fix tension-free
- Press on firmly

- Remove the remaining backing strip little by little
- Apply without introducing tension
- Press on firmly

How it should look:

- Wooden wall is joined to concrete floor

Dockskin® 200

P. 139

Wall: Timber construction

Windtight and rainproof on the outside

Mounting facade membrane for open facades – using SOB

- Apply Majvest 700 SOB with the smooth side facing you
- Secure the membrane above the adhesive joint using a stapler

- Lay the second membrane
- Overlap membranes by 10 cm
- Remove the two backing strips and press the bond firmly down

After sealing:

- For final attachment of the membrane mount counter slatting in **structure direction directly on the bearing structure**

How it should look:

- Majvest 700 SOB and Wigluv black be-
hind permanently open facade
- Suitable for facades with joint holes of ≤ 50 mm and a surface proportion of max. 40%

Wall: Timber construction
Windtight and rainproof on the outside

Majvest® 700 SOB

P. 132

Wigluv® black

P. 131

Wall: Timber construction *Windtight and rainproof on the outside*

Mounting facade membrane for closed facades

- Apply Majvest 200 with the lettering facing you

For closed facades:

- Align Wigluv centrally along the overlap and secure in place
- Apply it without tension and creases and press on **firmly**

After sealing:

- For final attachment of the membrane mount counter slatting **in structure direction directly on the bearing structure**

- Majvest 200 is suitable for rear-ventilated facades with closed facade covering

Wall: Timber construction

Windtight and rainproof on the outside

Tips and tricks

Majvest 200 overlap:

- Align Majvest 200 with the (a) overlapping line and lay it.
- Align Wigluv with the (b) bonding line and bond it.
- Press the bond on **firmly**.

Majvest 700 SOB overlap:

- Align Majvest 700 SOB with the lettering (a) or the backing strip (b) and lay it.
- Remove the backing strip and bond SOB.
- **Or else without SOB:** Align Wigluv black centrally and bond.
- Press the bond on **firmly**.

Majvest® 200

P. 133

Wigluv® 60

P. 128

Wall: Timber construction

Windtight and rainproof on the outside

Facade membrane penetration

- Cut off Wigluv 20/40:
leave approx. 4 cm on both sides
- Separate the narrow backing strip
and affix in the corner
- Separate the wide backing strip
and press on firmly
- Cut the corner at 45°

- Fold over
- Press on

- Repeat at each side of the penetration

Wall: Timber construction

Windtight and rainproof on the outside

4

How it should look:

- Square penetration sealed windtight using Wigluv 20/40.

5

How it should look:

- Penetration of open facade sealed in a windtight manner using Wigluv black 20/40
- Suitable for facades with joint openings of ≤ 50 mm and a maximum area of 40%.

For closed facades:

Wigluv® 20/40

P. 129

For open facades:

Wigluv® black 20/40

P. 131

Wall: Timber construction

Windtight and rainproof on the outside

Joining window to facade membrane

- Pre-fold the corner using Wigluv 20/40
- Affix precisely in the window corner
- Repeat at all corners

Connect corners:

- Align Wigluv 20/40 in the corner
- Remove narrow backing strip
- Affix the narrow side to the window frame and press on

- Remove the wide backing strip
- Affix the wide side to the facade membrane and press on firmly

Wall: Timber construction

Windtight and rainproof on the outside

4

How it should look:

- Window sealed windtight using Wigluv 20/40

5

How it should look:

- The window next to a visible facade is sealed windtight with Wigluv black 20/40
- Suitable for facades with joint holes of ≤ 50 mm and a surface proportion of max. 40%

For closed facades:

Wigluv® 20/40

P. 129

For open facades:

Wigluv® black 20/40

P. 131

Wall: Timber construction

Windtight and rainproof on the outside

Joining window alternatively to facade membrane

- Bond to windowsill joint profile **at the bottom**
- Projecting by joint width plus approx. 6 cm on both sides
- Press on firmly

- Bond laterally to the frame
- Press on firmly

Top corners:

- Form a loop: 1.5 x joint width
- Bond or press together firmly
- Repeat on the other side

- Install the window
- Suggestion: Mount a wedge for better water discharge $\geq 5\%$.
- Bond bottom edge diagonally
- Form trough

- Cut into the corners
- Bond Fentrim over the complete sill depth

Wall: Timber construction

Windtight and rainproof on the outside

- Bond Fentrim laterally over the complete reveal depth

- Cut into top corners
- Fold over and bond the excess
- Bond top corners diagonally, cut in, fold over and press on firmly

How it should look:

- Window frame joined to facade membrane impermeable to driving rain and windtight

Fentrim® IS 2

P. 145

Wall: Timber construction

Windtight and rainproof on the outside

Outdoor base joint

- Shake **Docks skin 100**
- Apply a covering coat
- Depending on temperature and substrate, wait until Docks skin 100 is transparent and sticky

- Apply Wigluv in the middle, align
- Peel off backing strips one after the other, press down
- **Note:** make sure to apply sufficient Wigluv on the concrete and woodfibre boards

Docks skin® 100

P. 127

Wigluv® 100 & 150

P. 130

Wall: Timber construction

Windtight and rainproof on the outside

Alternatively:

- Affix 50 mm side to facade membrane
- Affix perforated 85 mm side to concrete base
- Apply free of tension and creases and press it down vigorously

Alternatively:

- Apply Primur roll, align and press it down
- Remove backing strip
- Apply facade membrane free of tension and creases and press it down vigorously
- **Note:** This joint is suitable for Majvest 200 and Majvest 700

Fentrim® 2 50/85

P. 141

Primur® roll

P. 123

Roof *Airtight on the inside*

Mounting vapour control layer under flat or inclined roofs

- Use double-sided adhesive Twinet 20 when mounting vapour control layers on timber or metal substructures
- Avoids leaky stapling points

- Apply vapour control layer with the writing facing you

- Seal overlap with Sicrall avoiding tension and wrinkles

How it should look:

- Vapour control layer mounted on rafters/substructure and bonded to be permanently airtight

After sealing

- Attach battens
- Mount the interior cladding (protects against mechanical influences and UV radiation)
- For wide joists or extremely high insulation material weight we recommend installation of the membrane in the direction of the rafters, sealing in the rafter area and longitudinal installation of the battens

Majrex® 200

P. 115

Majpell® 5

P. 116

Twinet® 20

P. 126

Roof

Airtight on the inside

Vapour control layer overlaps

- Release the Sicral backing strip
- Position Sicral in the centre of the overlap and secure it in place

- Remove backing strip
- Apply Sicral free of tension and creases and press it down vigorously

How it should look:

- The overlap is sealed with Sicral 60 and permanently airtight

Sealing the crease so that it is airtight:

- Seal the crease in a "T" shape away from the overlap using Sicral

Butt-joint

- Apply Sicrall along the centre of the joint

- Press it on with a hard rubber roller
- Improves the immediate adhesion

- Vapour control layer joined to timber wall with Sicrall

Sicrall® 60

P. 118

Roof *Airtight on the inside*

Circular penetration

- Crease Rissan lengthwise

- Apply Rissan half to the pipe and half to the the vapour control layer without tension

- Apply Rissan around circular parts in layers

How it should look:

- The circular penetration is airtightly sealed with layers of Rissan 60

**Tips and tricks**

- For short pieces, separate Rissan from its backing strip
- Pull on Rissan and the backing strip simultaneously
- Block Rissan roll with one hand
- Use other hand to tear off Rissan over blade with a quick jerking movement

**Rissan® 60**

P. 120

Roof *Airtight on the inside*

Angular penetration

- Cut Corvum to length: add about 3 cm at each end
- Bond tightly into corner for joists (with folded edge against joist)
- Remove the backing strip
- Unfold, press on

- Cut into the excess, bisecting the angle
- **Start cut just short of the corner of the joist!**
- Repeat on each side of the joist

How it should look:

- Joist permanently airtightly sealed with Corvum 30/30

Corvum® 30/30

P. 124

Purlin joint

- Bond Corvum accurately to the purlin below the rafters with the pre-folded edge at the top
- Press on firmly

- Successively remove backing strip and bond vapour control layer to smooth inner of Corvum
- Press on firmly

- Unfold Corvum and mount vapour control layer

How it should look:

- The purlins have been airtightly bonded with Corvum 30/30

Corvum® 30/30

P. 124

Roof *Airtight on the inside*

Skylight joint

- Cut vapour control layer

- Cut vapour control layer to reveal depth

- Affix Corvum to vapour control layer with the folded edge flush with the sheet edge
- Press on

- With the backing strip folded back insert Corvum accurately into the groove, **affix Corvum all the way to the corner**
- Successively remove backing strip
- Press on

- Mount the remaining vapour control layer sheets: Cut sheet to size
- Affix Corvum with the folded edge flush with the sheet edge on three sides

- With the backing strip folded back insert Corvum accurately into the groove
- **Affix Corvum all the way to the corner**
- Successively remove backing strip
- Press on

- Seal the sides

- Cut out 90° angle pieces from 4 short pieces of Corvum
- Seal the corners

Roof

Airtight on the inside

- Finally seal the overlaps using Sicral 60

How it should look:

- Skylight permanently airtightly sealed with Corvum 30/30 and Sicral 60

Corvum® 30/30

P. 124

Mounting vapour control layer for injection insulation

- Prepare rafter bottom side with Twinet 20 to prevent uncontrolled filling of neighbouring field
- **Attention:** Twinet 20 is not designed for permanent carrying of the insulation material weight

- Apply vapour control layer with the writing facing you, **press firmly onto Twinet 20**
- Overlap the membranes by approx. 10 cm

3 crosswise to the supporting structure

4 longitudinally to the supporting structure

- **Before injecting the insulation material:**
Install battens (to carry the insulation material weight)
For the installation of the counter battens perpendicular to the structure, fix the structure as shown in the diagram so as to clamp the two membranes

Roof *Airtight on the inside*

- Make a star cut
- Inject insulation material
- Provide tight joists with an air outlet hole

- Paste over injection hole using Sicrall 170

- Finally install interior cladding (protects against mechanical influences and UV radiation)

- Further information about injection insulation is available at www.siga.swiss or in our user folder
- Ask your SIGA contact person if you have any technical questions
- Always use the injection insulation material according to the manufacturer's instructions
- Installation of vapour control layer with stapler: staple distance ≤ 15 cm
- Majrex 200 and Majpell 5 can be used with all types of injection insulating material

Tips and tricks

- We recommend (e.g. for flat roofs, wide joists or extremely high insulation material weight) installation of the membrane in the direction of the rafters, sealing in the rafter area and longitudinal installation of the battens.

Majrex® 200

P. 115

Majpell® 5

P. 116

Sigrall® 170

P. 119

Roof *Airtight on the inside*

Mounting vapour control layer for roof renovation from the outside

- Fit a sheet of insulating material with a solid structure between the rafters (protects vapour control layer against sharp, protruding objects)
- Seal vapour control layer at the lowest part of the rafters using Twinet 20

- **Apply Majrex 200** with the unprinted side facing towards you
- Overlap membranes by approx. 10 cm, fix in place with Twinet 20 and additionally with a stapler if required
- See photo 2a for mounting of Majpell 5

- Seal overlaps and penetrations airtightly using Wigluf 60
- Not suitable for makeshift coverage/ construction coverage

- Fill insulation material in compartments in a tight fit

Roof Airtight on the inside

Roof renovation from the outside with Majpell 5:

- Lay **Majpell 5** with the smooth side and the writing facing you

- Seal vapour control layer (a) airtight at the bottom of the rafters with **Twinet 20** (b)
- Thermal insulation layer (c) above the rafters $R \geq 1.1$
- For locations > 800 above sea level plan with a building physicist
- Optional (d) Majcoat 150 & Majcoat 150 SOB / Majcoat 200 SOB / Majcoat 250 SOB / Majcoat 350

Majrex® 200

P. 115

Majpell® 5

P. 116

Twinet® 20

P. 126

Roof *Airtight on the inside*

Mounting vapour control layer for above-rafter insulation

- Apply Majrex 200 with the unprinted side facing towards you
- Overlap membranes by approx. 10 cm, fix in place with Twinet 20 and additionally with a stapler if required

- Seal overlaps and penetrations airtightly using Wigluv 60
- Not suitable for makeshift coverage/ construction coverage

How it should look:

- Majrex 200 for above-rafter insulation

Above-rafter insulation with Majpell 5:

- **Lay Majpell 5** with the smooth side and the writing facing you

- (a) Thermal insulation between joists
- (b) Covering insulation \geq thermal insulation between joists
- (c) Majrex 200 / Majpell 5
- (d) Optional Majcoat 150 & Majcoat 150 SOB / Majcoat 200 SOB / Majcoat 250 SOB / Majcoat 350

P. 116

Wigluv® 60

P. 128

Roof

Windtight and rainproof on the outside

Installation of breathable membrane for alternative exterior renovation

- Fit sorptive insulating material without cavities to top edge of rafters
- If the previous insulation is to remain in place, add at least 40 mm of sorptive insulation (Figures 5 and 6)

- Lay the membrane with the writing facing you
- Secure the membrane in the overlap area using a stapler

- Lay the second membrane
- Ensure that there is an overlap of 10 cm
- Remove the two backing strips and press the bond firmly down in the application area

- Lay diffusion-open thermal insulation above Majcoat 200 SOB ≥ 52 mm

- (a) Diffusion-open thermal insulation layer above rafters ≥ 52 mm
 - (b) Majcoat 200 SOB / Majcoat 150 & Majcoat 150 SOB bonded so that it is airtight and rainproof
 - (c) Sorptive thermal insulation ≥ 40 mm laid without cavities
 - (d) Existing mineral rock wool laid without cavities
- Important note:** For locations ≥ 800 above sea level, plan with a building physicist
- (e) Majcoat 200 SOB / Majcoat 150 & Majcoat 150 SOB mit SIGA-System bonded rainproof

Majcoat® 200 SOB

Majcoat® 150 SOB

P. 135

Roof

Windtight and rainproof on the outside

Installation of underlay and roof membranes - with SOB

- Apply the membrane with the lettering facing you

- Fix the membrane above the adhesive joint using a stapler

- Lay the second membrane
- Overlap the membranes by approx. 10 cm
- Remove both backing strips

- Press the bond firmly down in the application area
- Install battens

Roof

Windtight and rainproof on the outside

How it should look:

See **Tips and tricks for installation**
P. 102-104

- **Protruding roll core (1)** protects Majcoat SOB up to the very last metre
- **Cutting aid (2) bonding aid (3) and twin-adhesive zone with adhesive applied on both sides (4)** save time

Majcoat® 200 SOB

P. 134

Majcoat® 150 SOB

P. 135

Roof

Windtight and rainproof on the outside

Tips and tricks

A Battens on supporting structure

- Mount counter battens in the direction of the supporting structure - directly on the supporting structure, e.g. rafters
- **Important:** counter battens must rest on the underlay with their complete surface

B Battens on boarding/ roof underlay membrane

- Mount counter battens directly on boarding or underlays which have been laid flush

C Heat insulating layer between battens and supporting structure

- Mount using suitable screws (e.g. full thread)
- Sufficient pressure resistance of heat insulation
- Wood-based softboards must be declared as under-roof /underlay boards
- Water carrying layer must be the same height at all points

- The use of nail sealing tape is recommended for effecting weather protection

Roof underlay membrane overlap

- Align Wigluf centrally along the overlap and secure in place
- Bond without tension and creases and press on firmly
- The printed bonding aid saves time

How it should look:

- The overlap is permanently windtightly sealed with Wigluf 60

Tips and tricks

- Release Wigluf from its backing paper
- Unroll a turn of Wigluf so that the backing strip is at the top
- **Advantage:** backing strip separates automatically on unrolling

Roof

Windtight and rainproof on the outside

- Membranes show different expansion and shrinkage characteristics
- **Make a stress-relief loop in the membrane** or seal overlaps with **Wigluv 100** if:
 - the counter battens do not rest on the solid underlay with their complete surface or
 - the membrane is laid vertically

Wigluv® 60

P. 128

Wigluv® 100

P. 130

Roof underlay membrane penetration

- Guide the membrane precisely around the circular penetration
- **Note: Start sealing at the lowest point!**
Provides extra protection against water penetration
- Fix Wigluv half on the circular penetration, then half on the membrane
- Press down firmly
- Apply subsequent pieces in overlapping layers

How it should look:

- Circular penetration sealed windtightly in layers with Wigluv 60
- Water will reliably run off

Wigluv®60

P. 128

Roof

Windtight and rainproof on the outside

Mounting of nail sealing tape

- Stick the nail sealing tape to the counter batten
- **Nail sealing tape should not exceed the width of the counter batten**

- Use backing strip for simple and quick application:
- Fold back the starting part of the backing strip
- Backing strip is handy and can be removed quickly later

- Align the counter batten with the backing strip folded back on the roof underlay membrane

- Separate the backing strip and press the counter batten down

- Finally mount the roof underlay membrane by screwing or nailing the counter battens to a solid support

Nail sealing tape

P. 137

Roof

Windtight and rainproof on the outside

Skylight joint

- Make a Y-cut in the roof underlay membrane to the size of the installation frame (see cutting pattern)
- Fold back the sides

- Fit the skylight into the mounting frame
- Screw it on
- **Read and observe the instruction manual supplied by the skylight manufacturer!**

- Secure the roof underlay membrane to installation and skylight frame on all sides

- Cut off approx. 3 cm below the top of the skylight frame

- Seal the corners windtight with short pieces
- **Note: Start sealing from the lowest point!**
Provides extra protection against water penetration

- Seal the roof underlay membrane all around the skylight frame so that it is windtight

How it should look:

- Skylight sealed windtightly with Wicluv 60
- Provide the penetration with extra protection with a deflection plate

Wicluv® 60

P. 128

Roof

Windtight and rainproof on the outside

Bonding woodfibre boards

Requirements for secure bonding:

- The substrate must be sustainable, swept clean and free of ice. It must not be adhesive-repellent

Joint, valley, roof ridge

- Prime with Dockskin 100
- Apply Wigluf in the middle, align

To create extreme adhesion:

- Shake high-performance primer Dockskin 100
- Apply a covering coat (a)
- Depending on the temperature and substrate wait until Dockskin 100 is **transparent** and **sticky** (b)

How it should look:

- Valley, ridge and joint are sealed windtightly with Dockskin 100 and Wigluf 100 or 150

Covering membrane

- Prime woodfibre board with Docks skin 100
- Apply Wigluv in the middle, align
- Remove both backing strips simultaneously, press on

How it should look:

- The transfer area between the covering membrane and the woodfibre board is sealed windtightly with Docks skin 100 and Wigluv 100

Docks skin® 100

P. 127

Wigluv® 100 & 150

P. 130

Roof

Windtight and rainproof on the outside

Penetration

- Prime with Dockskin 100
- Starting at the bottom and working upwards, cut Wigluv at both ends with approx. 5 cm excess
- Bond half of Wigluv onto the penetration and then half onto the woodfibre board

- Cut into the excess bisecting the angle and fold over
- **Do not apply the knife right in the corner!**

- **Starting at the bottom and working upwards:** repeat on each side

How it should look:

- The penetration is sealed windtightly with Dockskin 100 and Wigluv 100

Skylight

- Prime with Docks skin 100
- **Starting at the bottom and working upwards:** cut Wigluv to length with approx. 5 cm excess at both ends
- Bond half of Wigluv onto the frame and then half onto the woodfibre board

- Cut into the excess bisecting the angle and fold over
- **Cut just short of the corner!**

- **Starting at the bottom and working upwards:**
Repeat on each side

How it should look:

- The skylight is sealed windtightly with Docks skin 100 and Wigluv 150

Ceiling

Windtight and rainproof on the outside

Wetguard installation

- Clean the substrate
- Substrate must be dry, free from dust and grease and not adhesive repellent

- Align Wetguard with markings such as print out or chalk line
- Overlap Wetguard by 15 cm, at least more than 10 cm
- Roll Wetguard back again

- Release wide backing strips, beginning with slotting, and pull through under the roll
- Press Wetguard onto the substrate

- Remove the backing strips, unroll Wetguard and press firmly onto the substrate with a brush or surface wiper

For overlaps

- Overlap Wetguard by 15 cm, at least more than 10 cm
- Remove the thin backing strip and press down well

It looks like this

- Timber ceiling element adhered with Wetguard

- Bond element connecting joints e.g. butt boards etc. with Wetguard 390 mm

Wetguard® 200 SA

P. 147

Ceiling

Windtight and rainproof on the outside

Connections/intersections

- Seal connections to mineral substrates with Wigluv 100 or Wigluv 150
- Make the connection to timber/timber materials with Wigluv 100, Wigluv 150 or Wetguard 390 mm
- Pre-treat substrates in accordance with the SIGA instruction manual

Special reinforced paper: splash-water resistant • Temperature resistance: -40 °C to +100 °C

Suitable for airtight bonding acc. to:

CH: SIA 180: D: GEG, DIN 4108-7 AT: ÖNORM B 8110-2 UK: BS 5250

- ✓ **extremely adhesive
on both sides**
quick, safe installation
without stapler
- ✓ **protective coating
prevents soiling**
simple to apply
up to the end
- ✓ **tearproof backing strip**
saves time

Product specifications

Product	Article no.	Box	Pallet	Width	Length	Non-woven carrier thickness
Twinet 20	6610-2050	10 rolls	75 boxes	20 mm	50 m	0,35 mm

Twinet 20 is not suitable for permanent load-bearing applications • After installation, the vapour control layer must be additionally fastened, e.g. using jack rafters, counter battens, facing

Temperature resistance: -40 °C to +100 °C

- ✓ **quick drying**
saves time
- ✓ **strong adhesion**
extremely good adhesion
on soft fibre boards,
masonry and concrete
- ✓ **usable on cold substrates**
from -10° C
solvent-free

Product specifications

Product	Article no.	Coverage with Rissan/Wigluf 100	Coverage with Rissan/Wigluf 150	Box	Pallet

Product	Article No.	Box	Pallet	Width	Length
Wigluv black	7509-6040	10 rolls	48 boxes	60 mm	40 m
Wigluv black 20/40	7509-6025	10 rolls	42 boxes	20/40 mm	25 m

Diffusible special PO film • s_d value $< 2\text{ m}$ • Elastic, impermeable to water, UV-stable (freely exposed to the elements for 12 months) • Minimum roof pitch: 10° • The bond must not be under standing water • Temperature resistance: -40°C to $+100^\circ\text{C}$
Suitable for facades with joint openings of $< 50\text{ mm}$ and a maximum area of 40%

Wigluv black: Hand tearable

Wigluv black 20/40: Split and tear-resistant backing paper

- ✓ **extremely UV-stable**
resistant to ageing
and permanently tight
- ✓ **SIGA adhesive strength**
«on board»
sticks permanently and extremely well at high and low temperatures
- ✓ **robust and dimensionally stable**
easy to apply and visually very pleasing

Product specifications

Product	Article No.	Width	Length	m ²	Weight	Pallet
Majvest 700 SOB	8975-150033	1.5 m	33.4 m	50 m ²	16 kg	20 rolls

2-layered, acrylic coating on robust polyester fleece • Thickness: 0.6 mm

Weight per unit area: 270 g/m² • CE, EN 13859-2 • sd value: 0.02 m

Resistant to driving rain, waterproof: W1 (according to EN 1928)

Fire behaviour: Class B s1, d0 (according to EN 13501)

Temperature resistance: -40 °C to +80 °C • Meets the requirements of EN 13859-2 after 5000 hours of artificial ageing.

Suitable for facades with joint holes of ≤ 50 mm and a surface proportion of max. 40%

- ✓ **3-layer, tear-proof and flexible**
can be laid easily,
quickly and securely
- ✓ **for all closed facades**
for all-purpose application
- ✓ **cutting and bonding aid**
time saving

Product specifications

Product	Article no.	Width	Length	m ²	Weight	Pallet

Majvest 200 1.50 m	8910-150050	1.5 m	50 m	75 m ²	11 kg	20 rolls

3-layered, functional layer, reinforced on both sides with PP fibre-fleece • Thickness: 0.5 mm • Weight per unit area: 135 g/m² • CE, EN 13859-2 • s_d value: 0.05 m • Vapour resistance: <0.01 MNs/g
Resistant to driving rain, waterproof: W1 (according to EN 1928) • Fire behaviour: class E according to EN 13501-1 • Temperature resistance: -40 °C to +80 °C

Outdoor exposure: 4 weeks

- ✓ **SIGA adhesive strength “on board”**
sticks permanently and extremely well at high and low temperatures
- ✓ **3 layers, functional layer protected by 2 fleeces**
resistant to driving rain and durably moisture-diffusing
- ✓ **sturdy**
tear and abrasion resistant

Product specifications

Product	Article no.	Width	Length	m ²	Weight	Pallet
Majcoat 200 SOB	8765-150050	1.5 m	50 m	75 m ²	13 kg	30 rolls

3 layers, functional layer reinforced on both sides with PP non-woven • Thickness: 0.55mm

Weight per unit area: 150 g / m² • CEN EN 13859-1 / EN 13859-2 • sd value: 0.05 m

Vapour resistance: <0.01 MNs/g • Resistant to driving rain, waterproof: W1 (according to EN 1928)

Fire behaviour: class E (according to EN 13501-1) • Temperature resistance: -40 °C to +80 °C • The roof pitch must be at least 10°

Suitable as roof underlay for normal and increased requirements according to SIA 232

Complies with the ZVDH product data sheet Breathing membranes class UDB-A according to table 1

Suitable as roof membrane class USB-A

Suitable for makeshift coverage/construction cover for up to 4 weeks

Suitable SIGA accessories: Wigluv, Primur roll, Nail sealing tape

Majcoat 200 SOB: Suitable as rainproof roof underlay according to ÖNORM B 4119

- ✓ **SIGA adhesive strength**
«on board»
 sticks extremely strong at
 high and low temperatures
- ✓ **imprinted laying aid**
 fast and easy application
- ✓ **sturdy**
 tear and abrasion resistant

Product specifications

Produkt	Article no.	Width	Length	m ²	Weight	Pallet
Wetguard 200 SA 1560 mm	8220-156050	1560 mm	50 m	78 m ²	24 kg	16 rolls
Wetguard 200 SA 780 mm	8220-078050	780 mm	50 m	39 m ²	12 kg	32 rolls
Wetguard 200 SA 390 mm	8220-039050	390 mm	50 m	20 m ²	6 kg	64 rolls

Fleece with slip-resistant coating and full surface adhesive application • Transparent, robust and abrasion resistant • Weight per unit area: 260 g/m² • s_d value: 3.5 m • Resistant to driving rain, waterproof: W1 (according to EN 1928) • Fire behaviour: class E (according to EN 13501-1) • Temperature resistance: -40 °C to +80 °C

Heavy precipitation must be able to drain off in a controlled manner. We recommend installing appropriate drains to avoid permanent standing water.

Suitable for makeshift coverage/construction cover for up to 12 weeks

Suitable SIGA accessories: Wigluv

Warranty

The SIGA warranty covers the product characteristics guaranteed in the product data sheets when used in accordance with the manual.

The information in this manual is provided to facilitate ordinary intended use or ordinary suitability for use and is based on our knowledge and experience. However, it does not discharge users from their responsibility for reviewing suitability and use. With the publication of a new version of the manual, the previous version loses its validity. The currently applicable version is available on the internet.

The warranty is excluded if an application does not comply with the instructions in the manual, or:

- ▶ in case of unusual influences on the product, in particular of chemical or mechanical nature
- ▶ if permanent mechanical strain (e.g. due to tensile forces resulting from insulation material weight) has an impact on the seal
- ▶ in case of multi-layered membranes or panelling materials without sufficient cohesive strength
- ▶ in case of open facade cladding with Majcoat/Majvest, except for Majvest 700
- ▶ for Dockskin, if the adhesion is not executed with Wigluv, Rissan, Sicrall, Corvum, Primur, Twinet, or Fentrim
- ▶ if Fentrim IS is plastered over directly
- ▶ in case of airtight sealing in sauna and swimming pool applications
- ▶ if Fentrim / Fentrim 50/85 are applied directly on to a wood-based softboard
- ▶ in case of bonds against standing, non-pressing water according to DIN 18195 to 18535 / SIA 271
- ▶ if the requirements for a safe installation of the membranes are not fulfilled:
The substrate must be free from any protruding, harmful objects such as screws etc.
- ▶ if the requirements for reliable bonding are not fulfilled: The substrate must be dry, uninterrupted, even, capable to bear loads, free of dust and grease and must not repel adhesives. Clean substrate before bonding and perform adhesion test on site. If necessary, strengthen with high-performance primer Dockskin 100 / Dockskin 200. Caution! The bonds must not be under standing water. Creases or tensions in the membranes/ tape must be relieved by cutting and resealed.

Prerequisite for safe plastering over Fentrim:

- ▶ Before starting the plastering work make a plastering test on site
- ▶ Follow the recommendations of the plaster manufacturer

SIGA early warning system:

Thanks to the unique SIGA early warning system, any modifications and new developments in the field of standard substrates, boards or membranes, are systematically recorded and taken into account in the further development of SIGA products. Therefore, you should arrange for a regular inventory turnover to ensure that you always have SIGA products that are state-of-the-art in terms of technology and ecology.

Manual:

This manual can become invalid if new knowledge is acquired or new developments are made. The currently valid manual is available at www.siga.swiss

International Tests:

Our very low emission products are certified with the EMICODE

Technical details

Adhesive: SIGA high-performance adhesives are free of solvents, VOC, high boilers, plasticizers, chlorine and formaldehyde. They cannot be removed after application.

Working temperature: From -10 °C; Majcoat SOB from -15 °C; Primur cartridge and tubular bag: from +5 °C

Ageing resistance: Durable adhesive power; made without rubber, resins or solvents to prevent embrittlement.

Storage: Store SIGA products **cool** and **dry** in original packaging. In addition, store Primur cartridges, Primur tubular bags and Dockskin **frost-free**, and Majrex, Majpell, Majcoat and Majvest **away from UV radiation**. For Dockskin 200 and Meltell, **observe the use-by date**.
