

TILE LEVELLING SYSTEM

DISCS

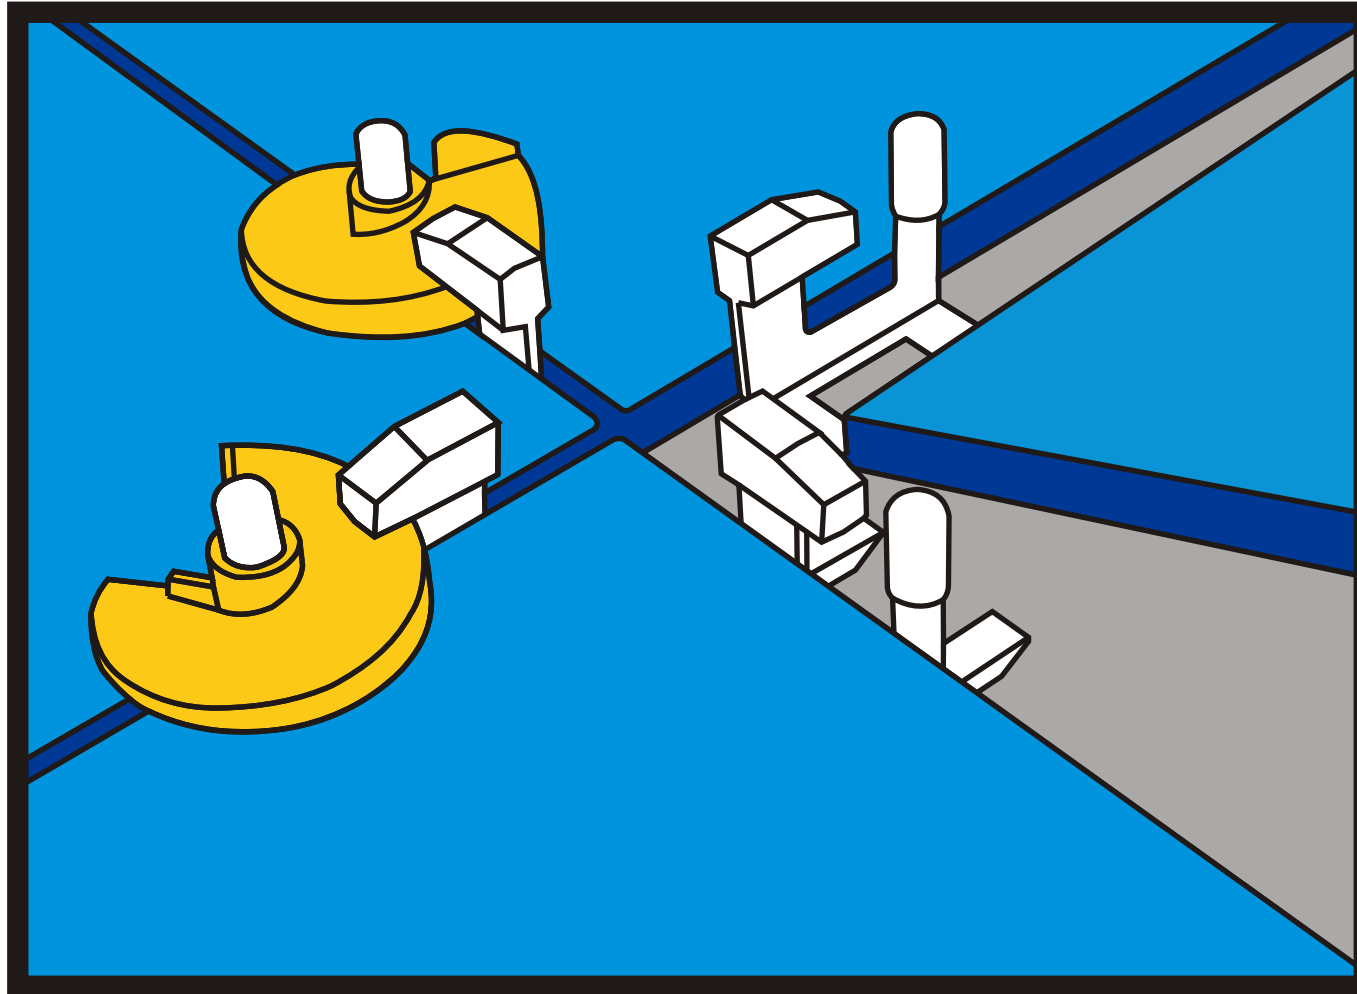

CLIPS

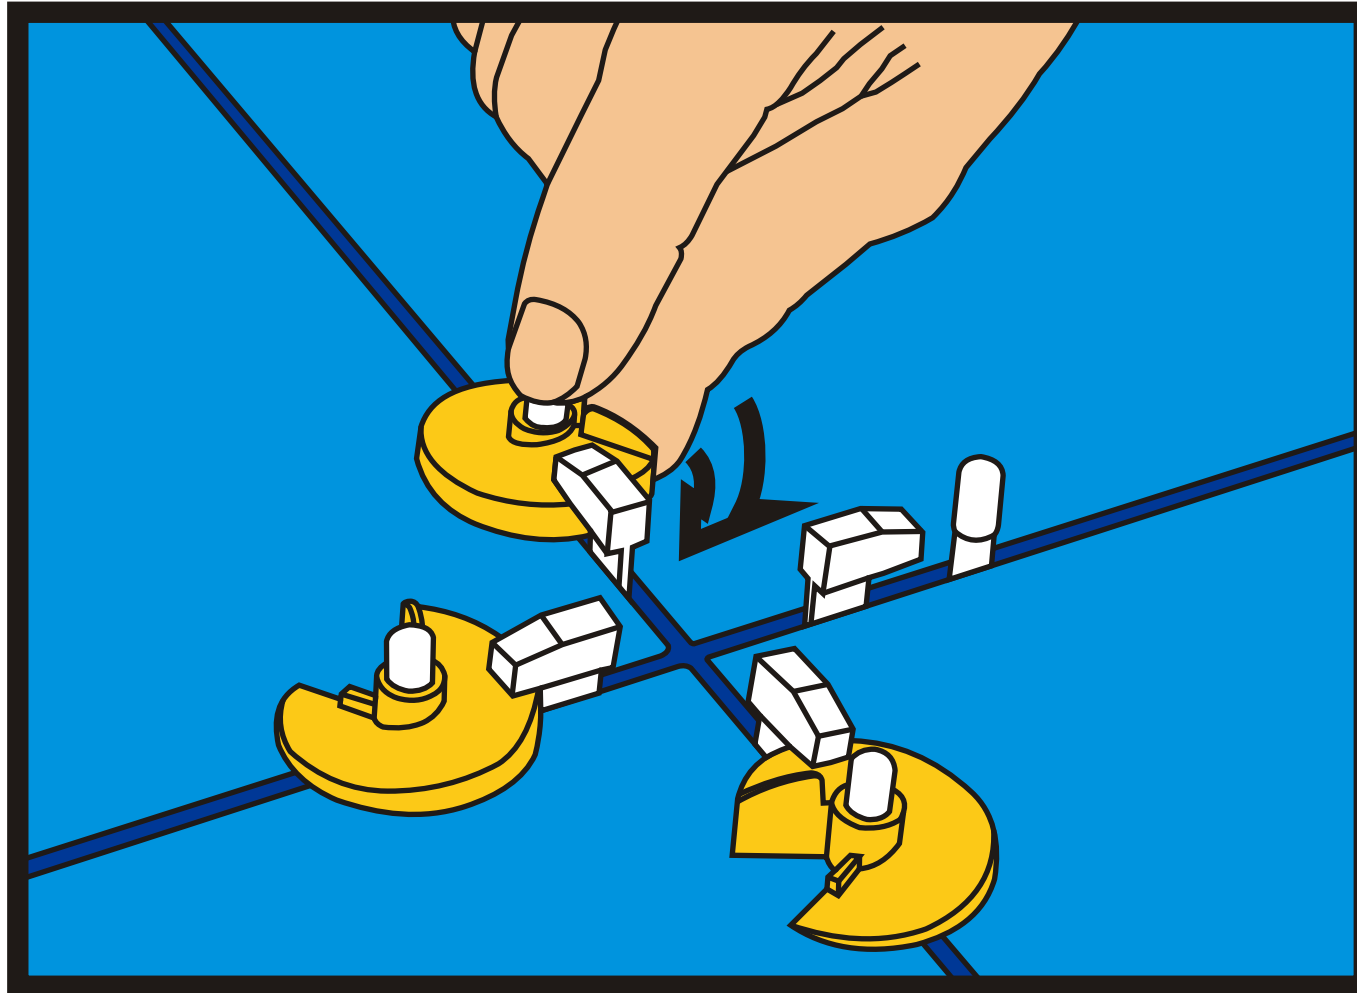

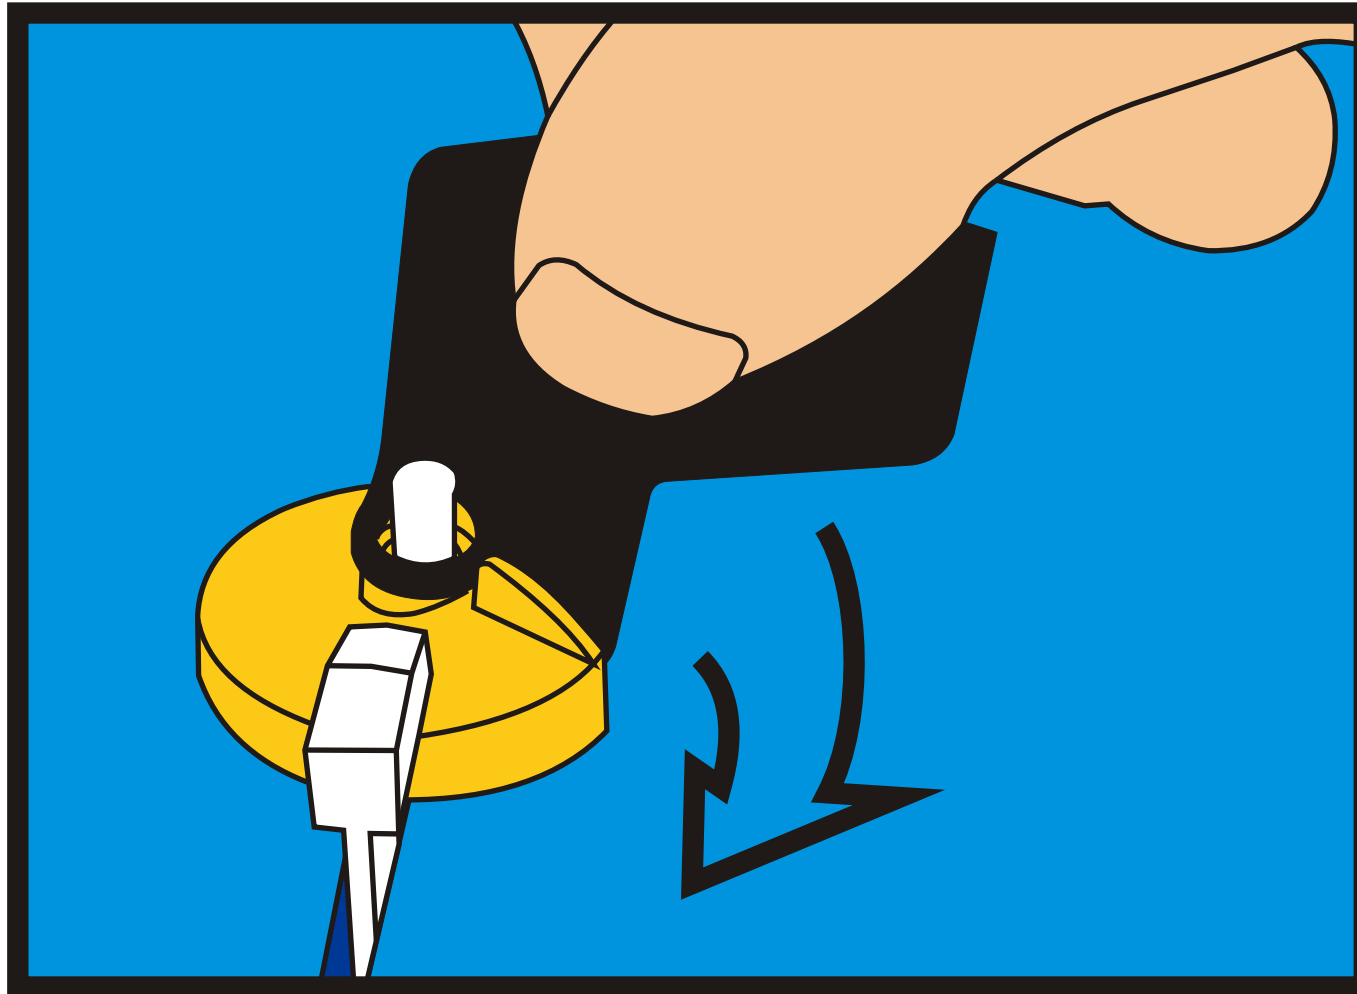

When syou start setting tiles block them with rollers at the wall.
Thanks to this when you set further tiles they will not change their
position.

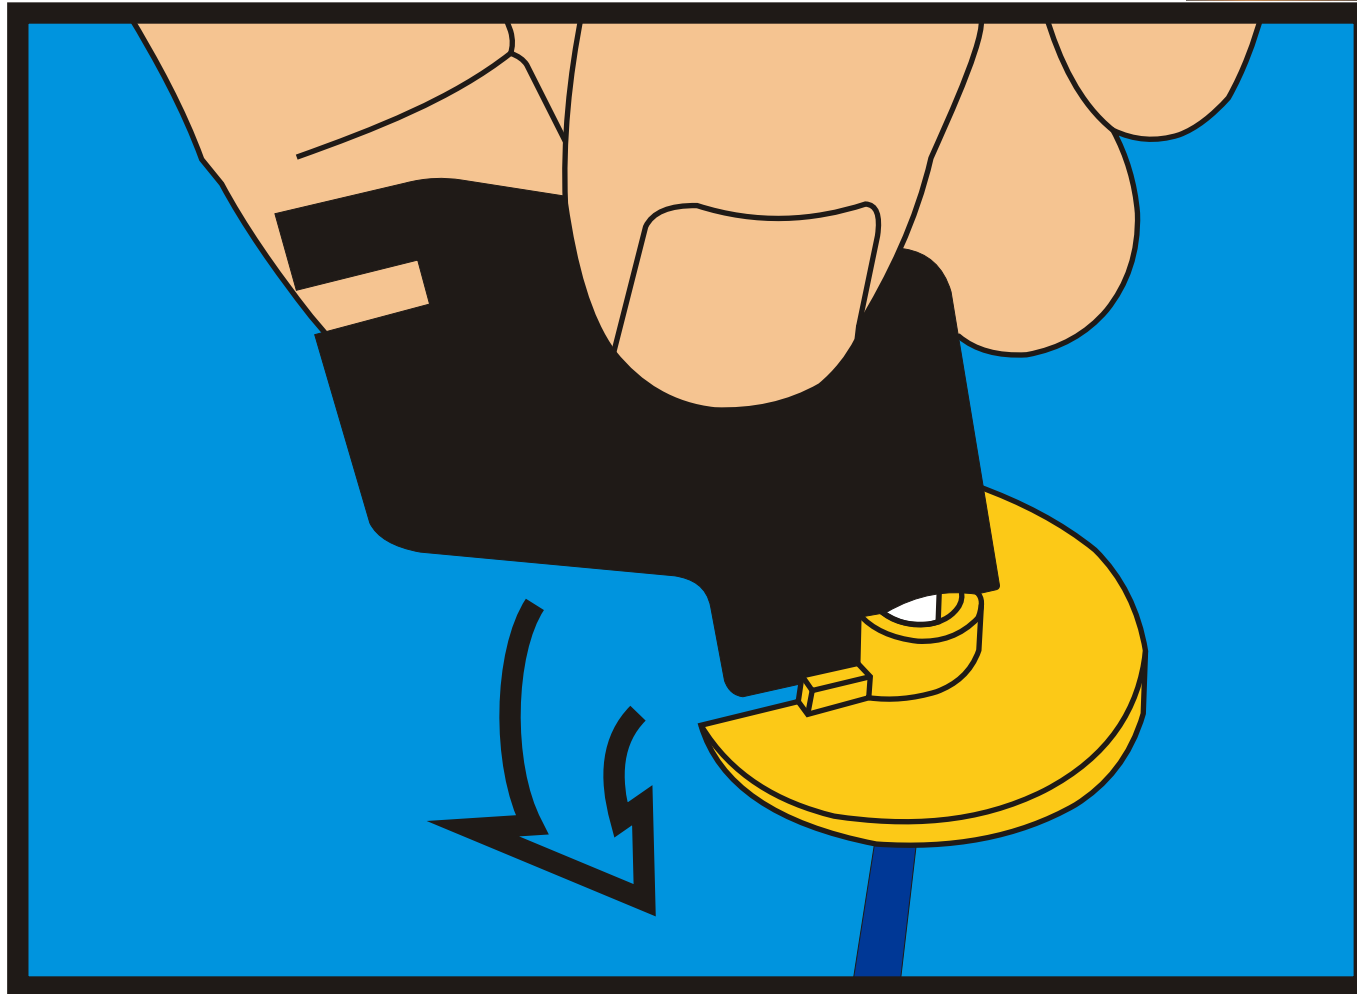

Clips should be located one at every corner, or one for four tiles.
Lay the tile pushing it against the clips.

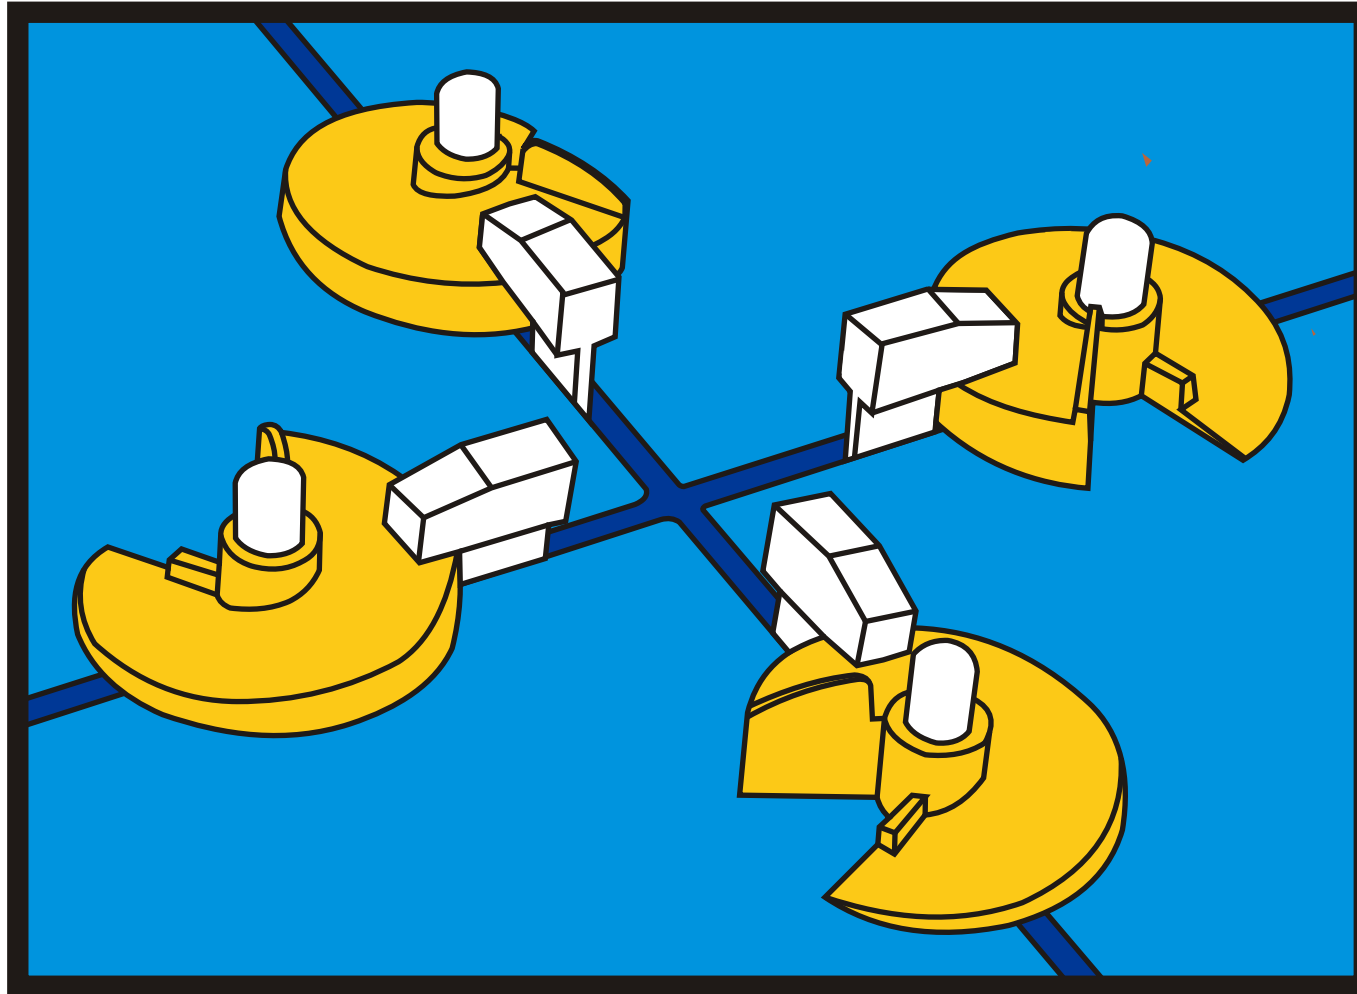

Turn the roller till it stops and then clip arms and a nub on the shank will lay **two tiles** in one surface.

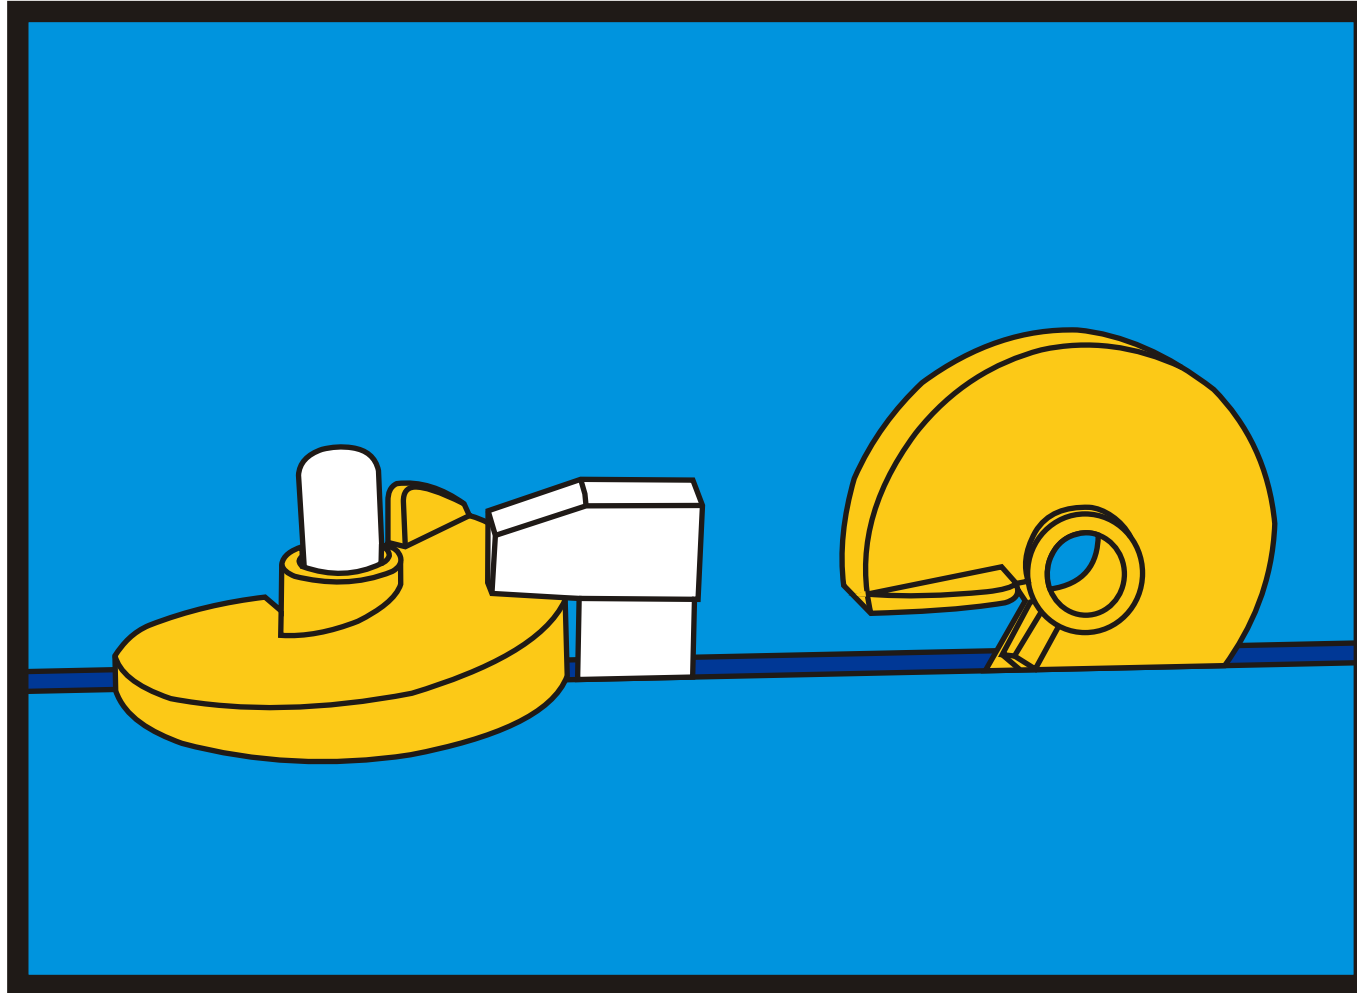

When tightening the system you can use a special tightening device.

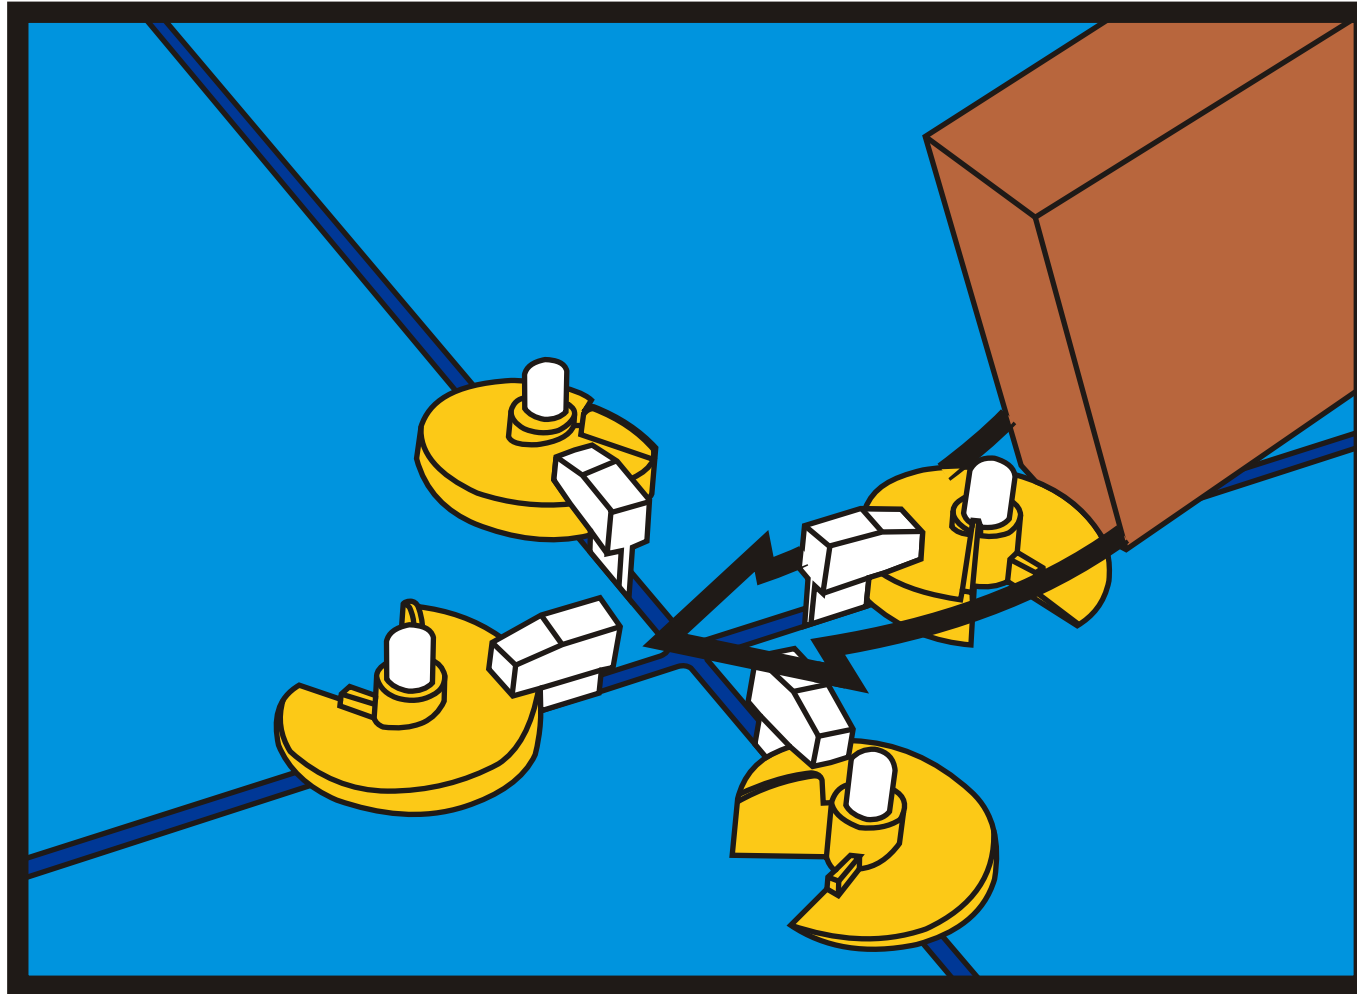

If you happen to find a crooked tile, using the device you can loosen the roller and minimize serration. If you find a damaged tile you can unbind the system and easily replace this tile.

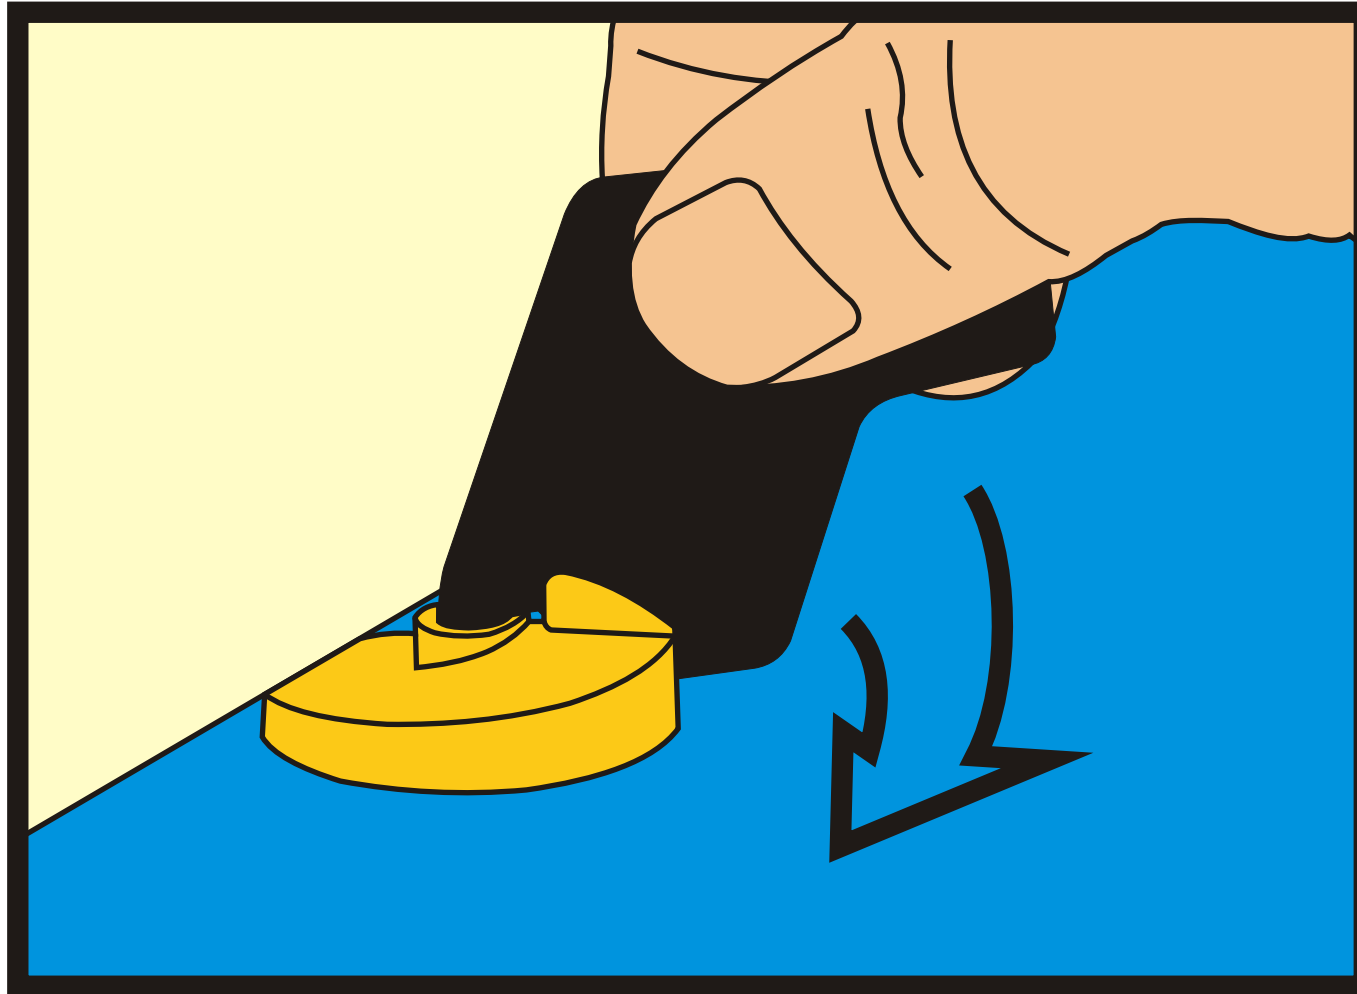

Place clips about 1 cm from the tile corner and you will get the best results in levelling all the tiles.

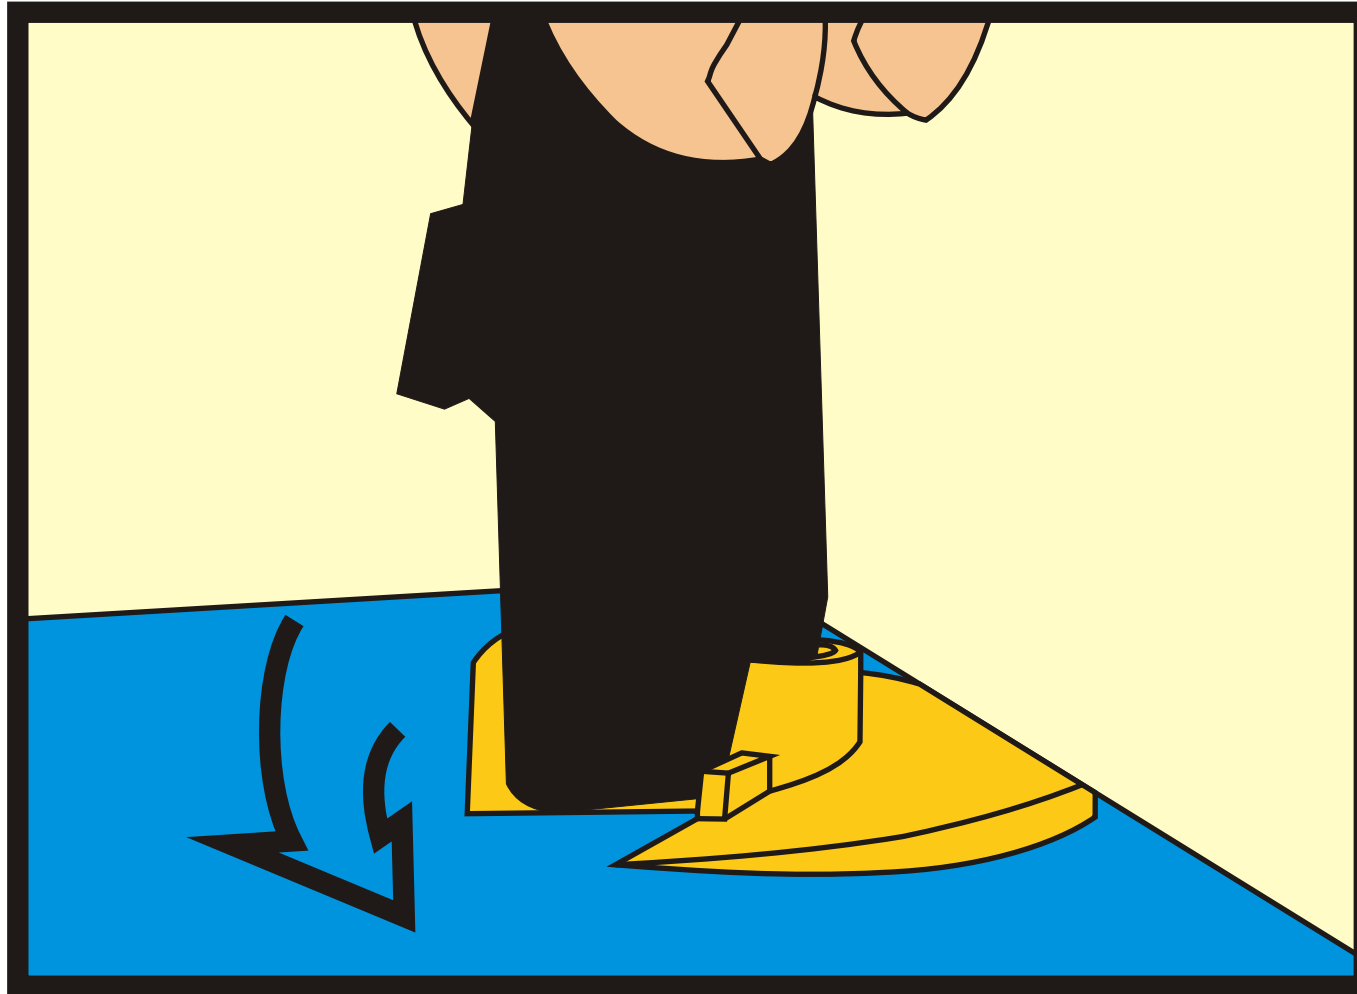

Tiles during production get shrinked in the oven even by 8%. All the time control laid tiles and when necessary place them closer or wider by means of the disc.

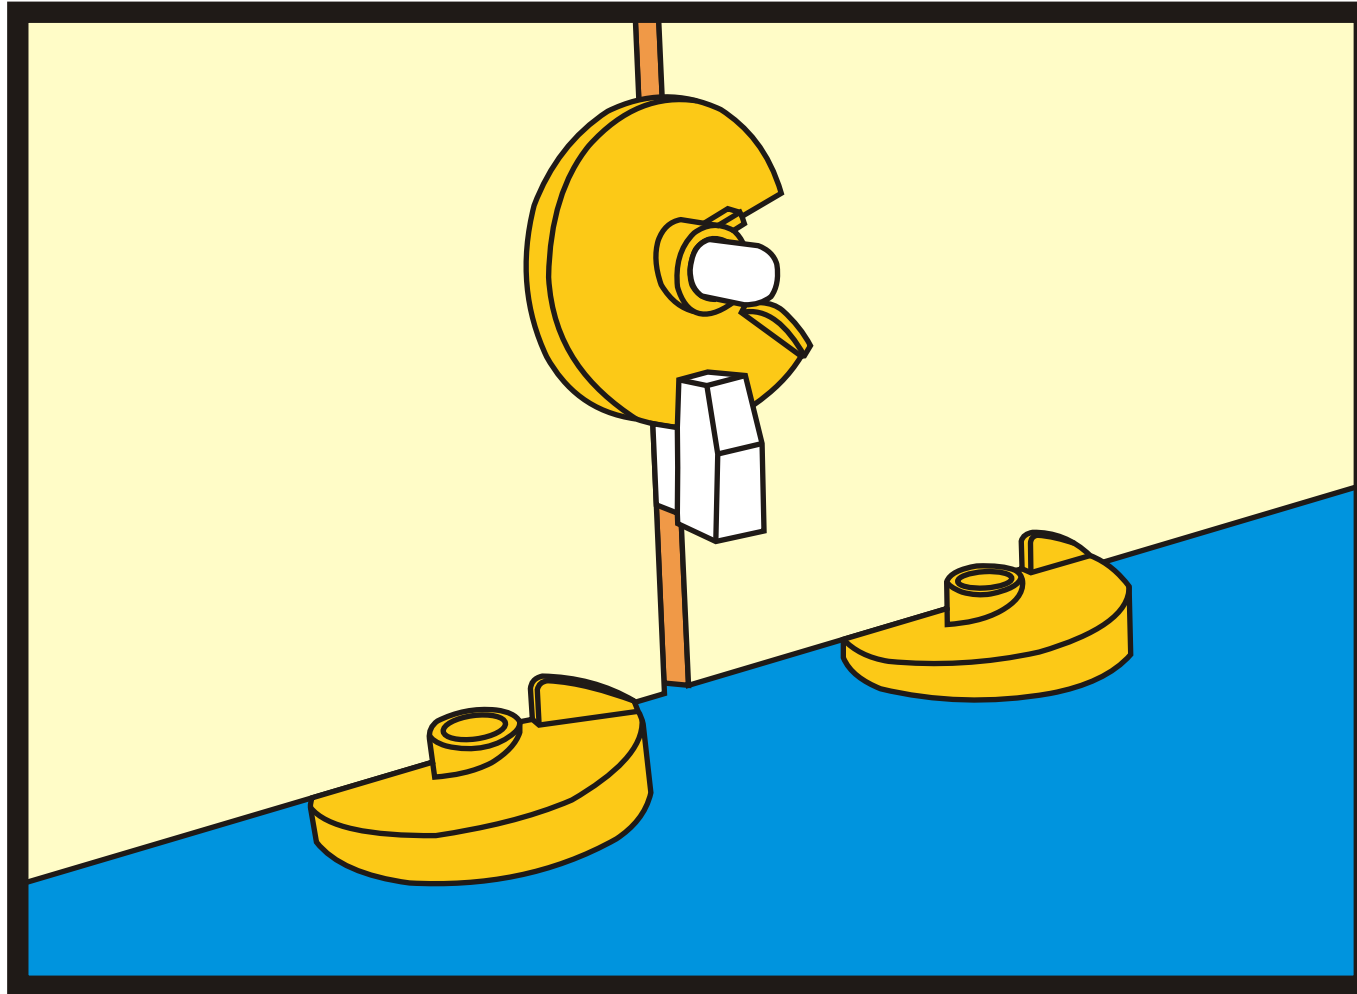

When the glue dries remove the projecting part of clip using your shoes or a rubber hammer. Undercuts will ensure that the rest of clip will stay underneath the tile.

When laying wall tiles the height of the first row is to be regulated by a disc.

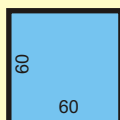

You may use for that a special locking device.

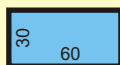

You will have equal surface of wall tiles in the same way as the floor ones.
